The Ability team conducts research at the intersection of HCI and AI, with the aim of developing innovative technologies that extend the capabilities of and enhance quality of life for people with disabilities (long-term, temporary, or situational). Overview. Brain-Computer Interface (BCI) is a system that measures central nervous system (CNS) activity and converts it into artificial output that replaces, restores, enhances, supplements, or improves the natural CNS output and thereby changes ...

Brain-Computer Interfaces - Microsoft Research
A brain-computer interface (BCI) recognizes the intent of the user through brain signals, decodes neural activity, and translates it into output commands that accomplish the user's goal. BCI technology has the potential to restore lost or impaired functions of people severely disabled by various devastating neuromuscular disorders or spinal cord damage, and to enhance or augment functions in healthy individuals.

Brain-Computer Interface Research on Apple Books
A brain-computer interface (BCI), sometimes called a neural-control interface (NCI), mind-machine interface (MMI), direct neural interface (DNI), or brain-machine interface (BMI), is a direct communication pathway between an enhanced or wired brain and an external device. BCI differs from neuromodulation in that it allows for bidirectional information flow.

Brain-computer interface - Wikipedia
Research in brain-computer interface (BCI) has significantly increased during the last few years. Additionally to their initial role as assisting devices for the physically challenged, BCIs are now proposed for a wider range of applications. As any human-machine interaction system, BCIs can benefit from adapting their operation to the emotional ...

Emotional Brain-Computer Interfaces — University of Twente
Brain Computer Interface (BCI) makes it possible to provide a communication channel from a human to a computer that directly translates brain activity into sequences of control commands. Such a device may give disabled people direct control over a neuroprosthesis or over computer applications as tools for communicating solely by their intentions that are reflected in their brain signals.
