The differences between dental implants and mini implants are design, size, and indications for use. Size: A mini implant is less than 3.3mm in diameter (and usually less than 3) while a normal implant is 3.4 to 5.8mm in diameter. Design: Mini implants consist of a post with a small ball at the end where the denture attaches.

Most mini-implants are made from either titanium or titanium alloy and histological studies show variable levels of bone-implant contact (BIC).^{2,3} However, it is misleading to refer to this as osseointegration. Rather, clinical usage and percussion indicate that mini-implants are mechanically retained (like bone fixation screws) rather than forming a clinically discernible ankylotic union with the

When the mini-implant displays obvious lateral mobility with light digital pressure then this indicates failure and the mini-implant should be removed. Fortunately, most mini-implant failures become clinically evident within the first few months of insertion, 4,8,9 enabling early replacement or a modification to the treatment plan. Conversely, when a mini-implant feels firm after two months in situ then normal orthodontic forces may be applied with confidence.
