binomial model as seen from the uniqueness of solution of equation (1.1.3)-(1.1.4). Finally, we note the wealth equation (1.2.14) can be written as  $X_{n+1} = X_n(1+r)^n + \int_0^n [S_{n+1}(1+r)^{n+1} - S_n(1+r)^n]$  This leads to a representation by discrete stochastic integral:  $X_e = X_0 + \int_0^T X_e$ ; where  $X_e = X_n(1+r)^n$  and  $S_e = S_n(1+r)^n$ ,  $n = 1, 2, \dots, N$ . Explain intuitively why, if you are told that  $X = 1$ , you would want to revise your estimate of the distribution of  $S_1$ . Solution. We first note that under P,  $X$  and  $S_1$  are dependent (as shown in part d) above). In fact, a simple calculation shows that  $P(S_1 = 8 | X = 1) = 1$

Solution. Define  $X_n = \prod_{i=1}^n (1 + 2i^{-1}) = \frac{2n!}{n!} = 2^n$ . Then  $X_n = 2^n X(1)$  for every  $n \geq 1$  where  $X$  is defined as in Example 1.2.5. So  $Z_n = \frac{1}{2^n} X_n = X(1)$  for every  $n$ . Clearly  $Z_n$  depends only on the first  $n$  coin tosses and  $\{Z_n\}_{n \geq 1}$  is the desired sequence. Exercise 1.5. A stochastic differential equation (SDE) is a differential equation in which one or more of the terms is a stochastic process, resulting in a solution which is also a stochastic process. SDEs are used to model various phenomena such as unstable stock prices or physical systems subject to thermal fluctuations. Typically, SDEs contain a variable which represents random white noise calculated as the derivative of Brownian motion or the Wiener process. However, other types of random behaviour are po
