A sequence of exercises for the isolation and characterization of invertase (E.C. 3.1.2.26) from baker's yeast obtained from a local grocery store is outlined. Because the enzyme is colorless, the use of colored markers and the sequence of purification steps are designed to "visualize" the process by which a colorless protein is selectively detected and isolated from a mixture of many different proteins.

A soluble form of invertase ( $\beta$ - d -fructofuranoside fructohydrolase, EC 3.2.1.26) has been purified from ripe banana fruit (*Musa cavendishii*). The enzyme has a high specific activity and an apparent MW of 220 000 daltons; it appears to be glycoprotein containing 12.5% mannose and 12% glucosamine.

Abstract. The invertase inhibitor was isolated, purified and characterized biochemically and electrophoretically from sugarbeet roots. Acid and alkaline invertase was found in roots of sugarbeet. The acid invertase activity decreased during development whereas the alkaline invertase persisted throughout the foot development.

This protein effectively inhibited the invertase activity in a dose-dependent manner. The results presented in the Lineweaver-Burk plots indicated that the invertase inhibitor displayed a mode of competitive inhibition towards the invertase tested, with a  $K_i$  of  $3.82 \times 10^{-6}$  mol L<sup>-1</sup>. CONCLUSION: These results suggested that SPITI is a novel member of the ITI family in plants.
