1. High-frequency sound waves are transmitted from a transducer.
2. These sound waves are then reflected by different tissue types in different ways.
3. The reflected sound waves are then picked up by the ultrasound transducer.
4. The sound waves are then transformed into an image by special software.

A Beginner's Guide to Ultrasound | including FAST scan ...

Ultrasound is a pressure wave which requires a medium for its propagation. Ultrasound propagates through tissue as a series of alternating areas of compression (area of high pressure) and rarefaction (area of low pressure). Sound is measured in cycles per second or Hertz (Hz), the audible range of sound is from 20 – 20,000 Hz. A thousand
