Differential Equations ... Workbook 19: Differential Equations 3. Exact equations Consider the differential equation $dy/dx = 3x^2$ By direct integration we find that the general solution of this equation is $y = x^3 + C$ where C is, as usual, an arbitrary constant of integration.

Differential Equations - Learn

Differential equations are called partial differential equations (pde) or ordinary differential equations (ode) according to whether or not they contain partial derivatives. The order of a differential equation is the highest order derivative occurring.

Differential Equations I

Power series representations of functions can sometimes be used to find solutions to differential equations. Differentiate the power series term by term and substitute into the differential equation to find relationships between the power series coefficients. Find a power series solution for the following differential equations.

Write down the general solution of this equation. Solution When $y = e^{4x}$, differentiation yields: $dy/dx = 4e^{4x}$ and $d^2y/dx^2 = 16e^{4x}$ Substitution into the left-hand side of the ODE gives $16e^{4x} - 6(4e^{4x}) + 8e^{4x} = 0$, which equals 0, so that $y = e^{4x}$ is indeed a solution. Similarly if $y = e^{2x}$, then $dy/dx = 2e^{2x}$ and $d^2y/dx^2 = 4e^{2x}$.

To find the particular solution of a differential equation, the arbitrary constants need to be given particular values. So, in the example, above if we replace $K = C = 1$, we get the solution $y = \cos x + \sin x$ which is termed as the particular solution of the differential equation. focuses the student's attention on the idea of seeking a solution of a differential equation by writing it as $y' = u(y)$, where y_1 is a known solution of related equation and u is a function to be determined. I use this idea in nonstandard ways, as follows: In Section 2.4 to solve nonlinear first order equations, such as Bernoulli equations and nonlinear
